

Exploring Microsoft Windows Server Features

Estimated time needed: 20 minutes

In this lab, you will familiarize yourself with the Windows Server Manager.

Objectives

After completing this lab, you will be able to:

1. Open and work with the Server Manager management console
2. Access remote, multi-server management

Important Information About Lab Instructions and Solutions

In case you try to use your physical keyboard in the lab environment, it might not produce any visible results. To avoid this issue, please use the On-Screen Keyboard (you can find it by searching for On-Screen Keyboard in the search bar at the bottom of your screen). If search functionality doesn't work, you can also click on the Windows icon, scroll down to find Windows Ease of Access, click on it, and then select On-Screen Keyboard.

Microsoft Windows operating system features can vary based on the Windows edition. If completing these exercises on your machine, your navigation and solutions may differ from what's presented in this lab.

Exercise: Get familiar with the Windows Server

In this exercise, you will learn how to open the Windows Server Manager and get familiar with a few essential things that you can do with the Windows Server. Please remember this lab resides in a virtual environment. So, any changes you make here will only last as long as the lab session is open.

1. Click the windows icon on the Windows virtual environment and choose Server Manager to open the **Windows Server Manager**.

2. This will take you to the dashboard, which displays all the details of your Windows server machine.

Server Manager

Server Manager ▸ Dashboard

Dashboard

- All Servers
- File and Storage Services ▸

WELCOME TO SERVER MANAGER

QUICK START

- 1 Configure this local server
- 2 Add roles and features
- 3 Add other servers to manage
- 4 Create a server group
- 5 Connect this server to cloud services

WHAT'S NEW

LEARN MORE

ROLES AND SERVER GROUPS

Roles: 1 | Server groups: 1 | Servers total: 1

File and Storage Services	1
Manageability	
Events	
Performance	
BPA results	

Local Server	3
Manageability	
Events	
Services	
Performance	
BPA results	

8/22/2022 1:10

Here, you can add roles and features, add other servers to manage, create a server group, and connect this server to cloud services. As mentioned, anything you change here will only last until the lab session opens.

3. Go to Local Server from the left menu. This lists the local servers in the virtual environment. You will see the computer's name, the work group it belongs to, the hardware, which in the case of the virtual environment is Amazon EC2, and the Operating System, which in this case is Microsoft Windows Server 2022. You can also see the RAM and the disk space that is allocated to the server.

4. You can open the Windows PowerShell from the menu (as shown in the image below) and run the terminal commands. PowerShell is a command line interface (CLI) to run the server management activities.

The PowerShell prompt looks like a regular command prompt. If you are familiar with the command prompt, try running a few commands in PowerShell.

Administrator: Windows PowerShell

PS C:\Users\Administrator>

5. Go to All Servers. You will see server instance details. There is just one server in this virtual machine, so that is all that is shown.

SERVICES

All servers | 1 total

Filter

Server Name

IPv4 Address

Manageability

EC2AMAZ-J5GP1U8	10.199.117.108	Online - Performance counters not started
-----------------	----------------	---

6. You can also search the server instances based on keywords and save such criteria with a name for easy retrieval repetitions.

Try giving a string not present in any of the server attributes. It will list nothing.

7. The image below shows that the criterion of filtering by string EC2 is saved as a query **EC2**. We can also specify a search criterion and look for the search string or filter within a particular attribute. Click the drop-down arrow button, as shown in the image below.

8. Select the attribute from the list menu that you want to search.

The screenshot shows the AWS Management Console 'Servers' page. The breadcrumb navigation indicates 'EC2@ Instances | 1 of 1 total'. A search bar contains 'EC2'. Below it, a dropdown menu labeled '+ Add criteria' is open, displaying a list of criteria with checkboxes: 'Server Name' (checked), 'Manageability', 'IPv4 Address', 'IPv6 Address', 'FQDN', 'Manageability', 'Description', 'Operating System Version', 'Type', 'Last Update', 'Processors', 'Memory (MB)', 'Cluster Name', 'Availability Type', and 'Cluster Role'. The 'Server Name' criterion is highlighted in blue. In the background, a table of instances is visible, with columns for 'Manageability', 'Last Update', and 'Windows Activation'. One instance is listed as 'Online - Performance counters not started' with a last update of '8/23/2023 6:40:28 AM' and a Windows activation key of '00430-00000-00000'.

9. You can also configure the type of events you want to get updates about on the server.

EVENTS

All events | 0 total

Filter

Configure Events

Refresh

Server Name	ID	Severity	Source	Log	Date and Time
-------------	----	----------	--------	-----	---------------

10. The period for which you need such updates and filters is based on the severity of the events.

11. Go to File storage and services, and you will see the server. You can also perform all the operations from the previous steps that you ran on the server here. In addition, there is a list of all the volumes under the **Volumes** tab. In this case, there is just one mounted disk, namely C:. In an actual Windows server, you may see two or more, including disk partitions, external drives, and any mapped network drives.

12. You can also open PowerShell for the particular volume from this panel.
