

Key Takeaways: Endpoint Security

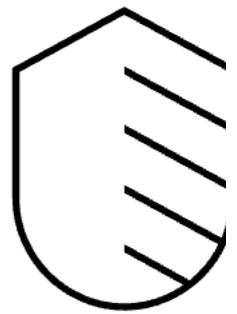

Estimated time needed: 5 minutes

- Multi-factor authentication is based on trust in the source platform.
- Endpoints refer to physical devices that connect to a computer network for information exchange.
- Vulnerability can come from both hardware and software devices

**Multi-Factor
Authentication
(MFA)**

**Mobile Device
Management
(MDM)**

**Endpoint
Detection**

Response (EDR)

- Visibility and control are keys to security. They dictate the type of hardware and software that are allowed within an organization.
- Controls can be in the form of:
 - Inventory
 - Policies
 - Patching
 - Encryption
 - Remote wipe
 - Location tracking
 - Anti-virus
 - Disposal
- Policies are implemented to achieve security. They include passwords (certain length, strength, and expiry date). They also ensure proper encryption.
- Policies should evaluate whether devices are monitored and under what conditions.
