

Glossary: Detection and Response

Term	Definition
Case management	Allows organizations to track, manage, and resolve cybersecurity incidents.
Endpoint detection and response (EDR)	Software designed to automatically protect an organization's end users, endpoint devices, and IT assets against cyber threats that get past antivirus software and other traditional endpoint security tools.
Extended detection and response (XDR)	An open cybersecurity architecture that integrates security tools and unifies security operations across all security layers: Users, endpoints, email, applications, networks, cloud workloads, and data.
Mean Time to Contain (MTTC)	Time is taken to fix and repair the system from an attack after identification.
Mean Time to Identify (MTTI)	Tracks the number of business hours between the moment an alert is triggered and the cybersecurity team begins investigating that alert. It is very helpful in understanding if alert systems are effective and security teams are staffed to the necessary capacity.
Reconnaissance	Time taken to prepare for the attack.
Security automation	Automate low-level, time-consuming, repetitive tasks like opening and closing support tickets, event enrichment, and alert prioritization. SOARs can also trigger the automated actions of integrated security tools. That means security analysts can use playbook workflows to combine multiple tools and automate more complex security operations.
Security Information and Event Management (SIEM)	A security solution that helps organizations recognize and address potential security threats and vulnerabilities before they have a chance to disrupt business operations.
Security orchestration	How SOAR platforms connect and coordinate the hardware and software tools in a company's security system.
Security Orchestration, Automation and Response (SOAR)	Helps security teams integrate security tools, automate repetitive tasks, and optimize incident response processes.
Threat hunting	Also known as cyber threat hunting is a proactive approach to identifying previously unknown or ongoing non-remediated threats within an organization's network.
Triage	Allows a caseworker to quickly gauge a client's needs by asking a core set of fundamental questions. The result allows the caseworker to understand the client's situation about the core needs.
