

Key Takeaways: Data Security

Estimated time needed: 5 minutes

Here are the key takeaways from the **Data Security** video.

Data security ecosystem comprises the following:

- Governance plan to analyze what should be done. It needs a data security policy to identify the key and sensitive areas:
 - Classification criteria to identify key issues and label them (confidential, unclassified, top secret, and so on)
 - Catalog to locate the data, especially the sensitive information
 - Resilience plan to plan for recovery in case of data breach
- Discovery to find sensitive data
 - Databases that contain structured data
 - Files, emails, and spreadsheets that contain unstructured data
- Protection of data
 - Encryption that requires data scrambling (for data in databases or in the network)
 - Managing the keys and creating them at random
 - Access control, which is a part of identity and access management
 - Backup to cope with a disaster recovery scenario
- Complying with industry regulations
 - Looking for general protection guiding bodies (GDPR Europe and HIPAA US)
 - Reporting when non-complying with these bodies
 - Retaining records in accordance with the law
- Security comprises detection
 - Monitor the systems and analyze how data is used and by whom
 - UBA (User Behavior Analytics) to monitor users and how they perceive data
 - Alerts that go to consoles and seek immediate action
- Response to security breach
 - Investigating cases
 - Dynamic playbook for situation handling
 - Automation and Orchestration of the cases
- Data Loss Protection (DLP) is a technology that helps to discover the data issues that are flowing across networks.
- Five areas that can remove the cost of data breach:
 - Artificial intelligence
 - DevSecOps
 - Incident Response (IR)
 - Cryptography
 - Employee training
